

HEAVY DUTY

NEW AND IMPROVED ... NAPA 3817 SUPERSEDES NAPA 3517

Improved serviceability and performance from an upgraded design

- Ford and IHC trucks ('94-'98) with Powerstroke 7.3L diesels
- Permanently attached plastic lid simplifies installations
- Media features phenolic resin binding
- Square-cut gasket for error-proof change outs
- Extremely effective removal of free and emulsified water

Our NAPA 3817 Cartridge-Style Fuel Filter has been designed for 7.3 liter Powerstroke diesel engines and offers a series of product improvements that benefit both installers and consumers.

Start at the top ... Unlike the OEM model with its reusable, segregated lid, the upgraded 3817 features a molded plastic lid integrated with the filter element as a single assembly for fast, easy disposal. One less part to fumble with during servicing.

Efficient water handling ... Our enhanced and robust media, with fibers bound by phenolic resins, provides exceptional separation capabilities for free and emulsified water. No extra membrane to wrap the media is required.

Error-free gasketing ... Our 3817 fuel filter comes with a square-cut gasket – not a bevel-cut one – so changeouts are completed quickly and with no confusion over gasket positioning.

Fact: The innovative design of the new NAPA 3817 is made apparent by its appearance, but the real proof is in the uncompromising fit and performance that it offers. New and improved for sure!
